

**MUKONO EXAMINATIONS COUNCIL 2018**  
**Uganda Advanced Certificate of Education**  
**CHEMISTRY**  
**P525/3**  
**MARKING GUIDE**

Volume of pipette used 25.0cm<sup>3</sup>

Experiment	1	2	3
Final burette readings / cm <sup>3</sup>	24.20	33.00	23.00
Initial burette reading/cm <sup>3</sup>	1.00	10.00	0.00
Volume of FA1 used /cm <sup>3</sup>	23.20	23.00	23.00

Volume of FA1 used to obtain average  
 23.00 and 23.00

Average volume of FA1 used

$$\frac{23.00 + 23.00}{2} = \frac{46}{2} = 23.00\text{cm}^3$$

a) Calculate the concentration of FA2 in moles per dm<sup>3</sup>.

(Ratio of reaction FA1:FA2 = 2 : 5)

RFM of KMnO<sub>4</sub> = (39 x 1) + (55 x 1) + (16 x 4) = 158

158g of KMnO<sub>4</sub> contains 1 mole

0.64g of KMnO<sub>4</sub> contains  $\left(\frac{0.64}{158} \times 1\right)$  moles = 0.004050633

Concentration of FA1 = 0.004 moles per dm<sup>3</sup>

1000cm<sup>3</sup> of FA1 contains 0.004moles of KMnO<sub>4</sub>

23cm<sup>3</sup> of FA1 contains  $\left(\frac{0.004}{1000} \times 23\right) = 0.00009$ moles of KMnO<sub>4</sub>

Moles of FA1 that reacted = 0.00009moles.

2 Moles of FA1 reacted with 5moles of FA2

Moles of FA2 that reacted  $\left(\frac{5}{2} \times 0.00009\right) = 0.00023$ moles

25cm<sup>3</sup> of FA2 contains 0.00023moles of ferrous ammonium sulphate.

1000cm<sup>3</sup> of FA2 contains  $\left(\frac{0.00023}{25} \times 1000\right) = 0.009316456 \approx 0.009\text{M}$

Concentration of FA2 = 0.009M

**Part B**

Volume of pipette used 25.0 cm<sup>3</sup>

Experiment	1	2	3
Final burette readings / cm <sup>3</sup>	6.70	15.60	25.50
Initial burette reading/cm <sup>3</sup>	1.00	10.00	20.00
Volume of FA1 used /cm <sup>3</sup>	5.70	5.60	5.50

Volume of FA1 used to obtain average

5.60 and 5.50

Average volume of FA1 used.

$$\frac{5.60 + 5.50}{2} = \frac{11.10}{2} = 5.55\text{cm}^3$$

(i) Write a balanced equation of reaction between FA1 solution and hydrogen peroxide.

(ii) Calculate the number of moles of FA1 used. (K = 39, Mn = 55, O = 16)

From (c) : concentration of FA1 = 0.004M

1000cm<sup>3</sup> of FA1 contains 0.004moles of KMnO<sub>4</sub>

1000cm<sup>3</sup> of FA1 contains 0.004moles of MnO<sub>4</sub><sup>-</sup>

$$5.55\text{cm}^3 \text{ of FA1 contains } \left( \frac{0.004}{1000} \times 5.55 \right) = 0.00002 \text{ moles}$$

Moles of FA1 that reacted = 0.00002 moles.

(iii) Calculate the concentration of H<sub>2</sub>O<sub>2</sub> in moles per litre in the dilute solution Q.

2 moles of FA1 reacts with 5 moles of Q

$$\begin{aligned} \text{Moles of Q that reacted} &= \left( \frac{5}{2} \times 0.00002 \right) \text{ moles of Q} \\ &= 0.00005 \text{ moles of Q} \end{aligned}$$

25cm<sup>3</sup> of dilute solution Q contains 0.00005 moles of H<sub>2</sub>O<sub>2</sub>

$$1000\text{cm}^3 \text{ of Q contains } \left( \frac{0.00005}{25} \times 1000 \right) \text{ moles of H}_2\text{O}_2$$

Concentration of H<sub>2</sub>O<sub>2</sub> = 0.002 moles per litre.

In dilute solution of Q is ≈ 0.002M

(iv) Calculate the concentration of H<sub>2</sub>O<sub>2</sub> in moles per litre in the concentrated solution of Q

5cm<sup>3</sup> of Q contains 0.002 moles of H<sub>2</sub>O<sub>2</sub>

$$\begin{aligned} 1000\text{cm}^3 \text{ of Q contains } &\left( \frac{0.002}{5} \times 1000 \right) \text{ moles} \\ &= 0.4 \text{ moles per litre.} \end{aligned}$$

Concentration of H<sub>2</sub>O<sub>2</sub> in concentrated solution of = 0.4 moles per litre.

2.

Tests	Observations	Deductions
a) Heat a spatula end full of W strongly in a test tube.	White solid colourless gas, turns blue litmus red and lime water milky. Yellow solid turns white on cooling white residue.	Non- transition metal cation Al <sup>3+</sup> , Ba <sup>2+</sup> , Ma <sup>2+</sup> or Ca <sup>2+</sup>  ZnO; Zn <sup>2+</sup> Al <sub>2</sub> O <sub>3</sub> ; Al <sup>3+</sup> BaO; Ba <sup>2+</sup> CaO; Ca <sup>2+</sup>

b) Place 2 spatula of W in a test tube and add 5cm <sup>3</sup> of water. Shake and filter. Keep the residue. Divide the filtrate into 4 parts.	Sparingly soluble colourless filtrate White residue	Non coloured metal cation present $\text{Al}^{3+}$ , $\text{Zn}^{2+}$ , $\text{Ba}^{2+}$ , $\text{Ca}^{2+}$ $\text{Mg}^{2+}$
(i) To the 1 <sup>st</sup> part, add 3 -4 drops of barium nitrate solution.	White ppt	$\text{SO}_3^{2-}$ , $\text{SO}_4^{2-}$ , $\text{CO}_3^{2-}$ , $\text{C}_2\text{O}_4^{2-}$
ii) To the 2 <sup>nd</sup> part, add 3 - 4 drops silver nitrate solution followed by dilute nitric acid	White ppt; soluble in acid forming a colourless solution	$\text{C}_2\text{O}_4^{2-}$
iii) To 3 <sup>rd</sup> part, add reagent of your own to confirm anion in the filtrate. Add dilute $\text{H}_2\text{SO}_4$ and warm followed by 3 drops of $\text{KMnO}_4$ solution.  Add acidified barium chloride solution and boil	Purple solution turns colourless with bubbles of a colourless gas, blue litmus turns red and lime water milky	$\text{CO}_2$ gas evolved  $\text{C}_2\text{O}_4^{2-}$ present
c) Shake the residue from (b) in dilute nitric acid. To the resultant solution, add sodium hydroxide solution dropwise until in excess and filter. Keep the residue for part (e).	White residue dissolves with bubbles of a colourless gas, blue litmus red and lime water milky. White ppt insoluble colourless filtrate White residue	$\text{CO}_2$ gas; $\text{CO}_3^{2-}$  $\text{Zn}^{2+}$ , $\text{Al}^{3+}$ or $\text{Pb}^{2+}$ or $\text{Sn}^{2+}$  $\text{Ba}^{2+}$ , $\text{Ca}^{2+}$ , $\text{Mg}^{2+}$ present
d) Acidify the filtrate using dilute nitric acid and divide into 4 parts.	White ppt, soluble forming a colourless solution.	$\text{Zn}^{2+}$ , $\text{Al}^{3+}$ , $\text{Pb}^{2+}$ , $\text{Sn}^{2+}$
(i) To the 1 <sup>st</sup> part, add dilute Sodium hydroxide solution drop wise until in excess.	White ppt, soluble forming a colourless solution.	$\text{Zn}^{2+}$ , $\text{Al}^{3+}$ , $\text{Pb}^{2+}$ , $\text{Sn}^{2+}$
(ii) To the 2 <sup>nd</sup> part, add dilute ammonia solution drop wise until in excess.	White ppt, soluble forming a colourless solution.	$\text{Zn}^{2+}$ present.

(iii) To the 3 <sup>rd</sup> part, add reagent of your own to confirm cation in the filtrate. Add solid $\text{NH}_4\text{Cl}$ followed by disodium hydrogen phosphate and excess ammonia solution.	White ppt, soluble in ammonia forming a colourless solution.	$\text{Zn}^{2+}$
b) Wash the residue with some water and transfer to a test tube; add dilute nitric acid to dissolve. Divide the mixture into 4 parts.	White residue dissolves forming a colourless solution.	$\text{Ba}^{2+}$ , $\text{Mg}^{2+}$ or $\text{Ca}^{2+}$
(i) To the 1 <sup>st</sup> part, add dilute sodium hydroxide solution wise till in excess	White ppt insoluble	$\text{Ba}^{2+}$ , $\text{Mg}^{2+}$ or $\text{Ca}^{2+}$
(ii) To the 2 <sup>nd</sup> part, add dilute ammonia solution drop wise till in excess	White ppt; insoluble	$\text{Ba}^{2+}$ , or $\text{Mg}^{2+}$
(iii) To the 3 <sup>rd</sup> part, 3 -4 drops of dilute sulphuric acid.	White ppt	$\text{Ba}^{2+}$
(iv) To the 4 <sup>th</sup> part, potassium chromate solution followed by excess sodium hydroxide solution	Yellow ppt insoluble in $\text{NaOH}$	$\text{Ba}^{2+}$

Cations  $\text{Zn}^{2+}$  and  $\text{Ba}^{2+}$

Anions  $\text{C}_2\text{O}_4^{2-}$  and  $\text{CO}_3^{2-}$

3.

	Tests	Observations	Deductions
a)	Burn a small amount of K on a spatula.	K is a colourless liquid that burns with a yellow sooty flame.	K is an aromatic compound.
b)	Shake three drops of K with about $2\text{cm}^3$ of water and allowed to stand. Test with litmus.	K is immiscible with water and has no effect on litmus	K is non-polar and neutral compound probably alcohols or carbonyl compound.

c)	To 1cm <sup>3</sup> of K in a test tube, add a spatula of NaHCO <sub>3</sub> .	No observable change	Carboxylic acid absent
d)	To 3 drops of K in a test tube, add a few drops of neutral iron (III) chloride solution.	No observable change	Phenol absent
e)	To a portion of K, add 3 – 5 drops of 2,4-dinitrophenyl hydrazine solution.	No observable change	Carboxylic compound absent
f)	To a portion of K, add 2-3 drops of acidified K <sub>2</sub> Cr <sub>2</sub> O <sub>7</sub> solution. Heat the mixture and divide into 2 portions.	Orange solution turns green	K is oxidized, Alcohol present.
(i)	To the 1 <sup>st</sup> portion, add 3-4 drops of 2,4 dinitrophenyl hydrazine.	Orange precipitate	Aromatic carbonyl compound present from oxidation of alcohol.
(ii)	To about 3cm <sup>3</sup> of silver nitrate solution, add 3cm <sup>3</sup> of NaOH solution followed by ammonia solution until the precipitate just dissolves. Add to the 2 <sup>nd</sup> portion above, shake and heat in a water bath.	Grey precipitate  No observable change	Aldehyde present from oxidation of alcohol (aromatic 1° alcohol).  Aldehyde absent; due to complete oxidation of alcohol to carboxylic acid

**Comment on the nature of K**

- K is a aromatic primary alcohol
- K – aromatic compound
- OH attached to a methyl group
- Attached to benzene ring.

**END**
