(iii)

From,  $E(x) = \sum_{all\ x} xP(X = x)$

$$E(x) = 1\left(\frac{1}{28}\right) + 2\left(\frac{4}{28}\right) + 3\left(\frac{9}{28}\right) + 4\left(\frac{9}{28}\right) + 5\left(\frac{4}{28}\right) + 6\left(\frac{1}{28}\right) = 3.5$$

From,  $var(x) = E(x^2) - ((E(x))^2)$

But,  $E(x^2) = \sum_{all\ x} x^2P(X = x)$

$$E(x^2) = 1\left(\frac{1}{28}\right) + 4\left(\frac{4}{28}\right) + 9\left(\frac{9}{28}\right) + 16\left(\frac{9}{28}\right) + 25\left(\frac{4}{28}\right) + 36\left(\frac{1}{28}\right)$$

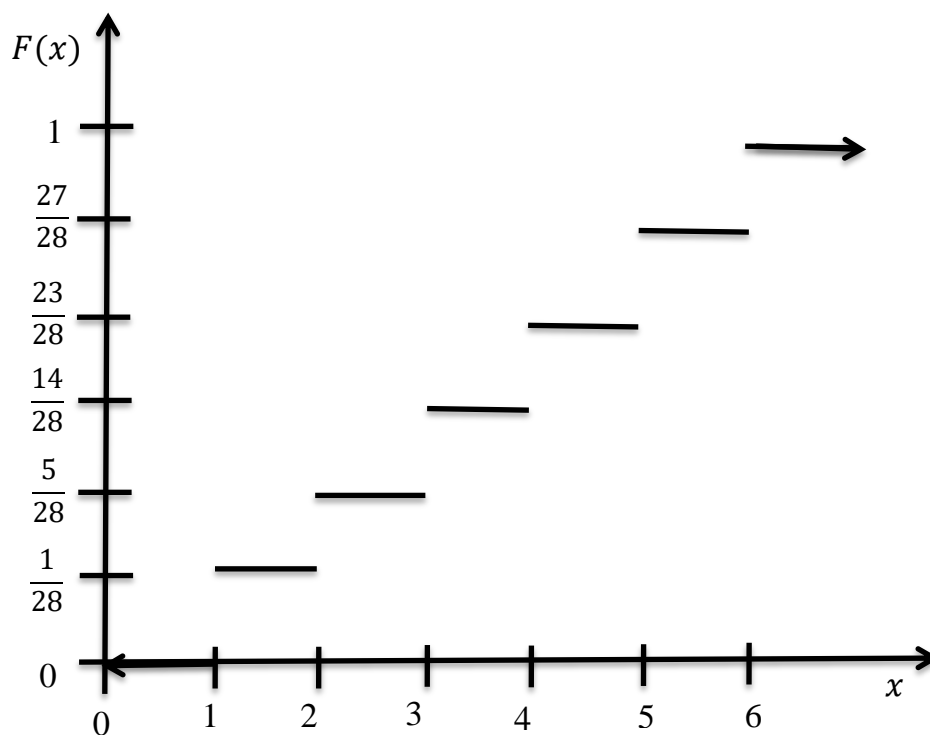

$$E(x^2) = 13.5$$

$$var(x) = 13.5 - ((3.5)^2)$$

$$var(x) = 1.25$$

(b)

$x$	1	2	3	4	5	6

13

(a)

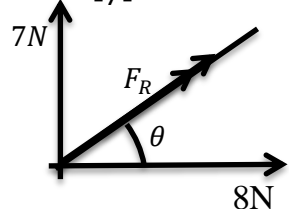

Resolving horizontally,

$$F_x = 2 + 3 + 2\sqrt{2}\cos 45^\circ + \sqrt{2}\cos 45^\circ = 8N$$

Resolving vertically,

$$F_y = 4 + 2 + 2\sqrt{2}\sin 45^\circ - \sqrt{2}\sin 45^\circ = 7N$$

$$\vec{F}_R = \begin{bmatrix} 8 \\ 7 \end{bmatrix}$$

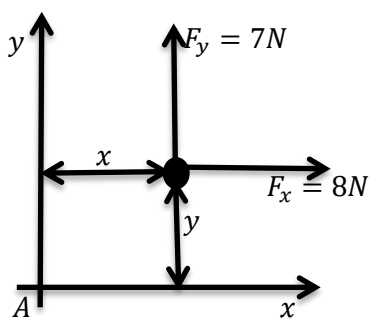

$$|\vec{F}_R| = \sqrt{(F_x)^2 + (F_y)^2}$$

$$|\vec{F}_R| = \sqrt{(8)^2 + (7)^2} = 10.6301N$$

$$\text{From, } \theta = \tan^{-1}\left(\frac{F_y}{F_x}\right) = \tan^{-1}\left(\frac{7}{8}\right) = 41.2^\circ$$

Therefore the resultant force is 10N and acts at  $41.2^\circ$  above the positive x-axis.

(b)

From the figure,  $\curvearrowleft G = yF_x - xF_y$  (Clockwise moments about A)

But taking clockwise moments about A;

$$\curvearrowleft G = 3 \times 2 - 2 \times 2 + (\sqrt{2})x \frac{\sqrt{8}}{2} = 4Nm$$

$$yF_x - xF_y = 8y - 7x = 4$$

Therefore the equation of line of action of the resultant force is;

$$8y - 7x = 4$$

<p>16 (a)</p>	 <p>           From, <math>s = ut + \frac{1}{2}at^2</math>            For P, <math>s = (49\sin 30^\circ)(t) - \frac{1}{2} \times 9.8 \times t^2</math>            For Q, <math>s = (49\sin 30^\circ)(t - 2) - \frac{1}{2} \times 9.8 \times (t - 2)^2</math> </p> <p>           At the point they met, they had travelled the same distance, therefore;  <math>(49\sin 30^\circ)(t) - \frac{1}{2} \times 9.8 \times t^2 = (49\sin 30^\circ)(t - 2) - \frac{1}{2} \times 9.8 \times (t - 2)^2</math>  <math>68.6 = 19.6t</math>  <math>t = 3.5 \text{ seconds}</math>  <math>h = (49\sin 30^\circ)(3.5) - \frac{1}{2} \times 9.8 \times 3.5^2 = 25.725m</math>            Therefore the two met at 25.725m from the start.         </p>	

(b)	<p>Distance between A and B is <math>d = d_1 + d_2</math></p> <p>From, <math>s = ut + \frac{1}{2}at^2</math></p> <p>Horizontally there is no acceleration.</p> <p><math>d_1 = (49\cos 30^\circ)(3.5) = 148.5234m</math></p> <p><math>d_2 = (49\cos 30^\circ)(3.5 - 2) = 63.6529m</math></p> <p><math>d = 148.5234 + 63.6529 = m</math></p> <p>Therefore the distance between A and B is 212.1763m</p>
